## 1. Resource Management:

<<A computer consists of a set of resources such as processors, memories, timers, disks, printers and many others.

| The Operating System manages these resources and allocates them to specific programs.

<<| As a resource manager, the Operating system provides the controlled allocation of the processors, memories, IO devices among various 'programs.

<<| Moreover, multiple user programs are running at the same time, the 'Processor itself is a resource and the Operating System decides how much Processor time should be given for the execution of a particular user program,

## 2. Virtual Machine Management:

An operating system (OS) has two main jobs:

+ It makes computers easy to use by hiding hardware complexity.

+ It manages computer parts like memory, storage, and CPU.

Users don't need to control storage devices manually. Instead, the OS organizes data into files (like photos, emails, or web pages)

The OS provides simple commands like read, write, save, or delete to manage files easily.

Instead of handling complicated hardware, users interact with a simple and user-friendly

'Application program
